Christmas trees

Christmas trees and greenery

We began producing greenery and Christmas trees in 2002. At that time harvesting took place on leased fields that others had planted.

We established the first plantations of our own with Nordmann fir in 2006. These areas have gradually been expanded and we now cultivate approximately 45 hectares of Christmas trees and just under 15 hectares of Noble fir and Nordmann fir for the production of greenery. Most of the plantations are on the island of Lolland, but we also have plantations on Zealand.

Cultivation

Our production of Christmas trees began in quite a traditional way, but we gradually stepped up the intensity of our cultivation in line with increasing market demand for high-quality trees and greenery. All our Christmas trees are now grown 100% intensively, which means all trees has manually been cut in the bottom and are all individually regulated in both width and height.

In addition we carry out weed, insect and algae control. Furthermore we fertilise all our trees manually to maximise utilisation of the added nutrients and to minimise leaching. Most of the areas are fertilised with slowly biodegradable biological fertiliser in the form of pelleted chicken droppings. We have found this type of fertilisation effective and gives us a lush and full-bodied greenery with long needles and an attractive dark green colour.

Delivery of Christmas trees

We mark our Christmas trees ourselves based on the customer's wishes. Most of the trees are delivered packed in nets on pallets. They are packed according to individual agreements with the customers to ensure that we deliver the most suitable tree for the customer.

Trees taller than 2½ metres are also delivered in nets, but are loaded loosely on the lorry. The trees are felled, netted and packed as late as practically possible to keep them fresh.

Goals

Our main goal is to produce approximately 20,000 shapely, healthy Christmas trees. In principle, they can be any height, but we specialise in trees taller than 175 cm, with a large proportion exceeding 2 metres.

We take great care to consider the surrounding environment in our production and in the long term we will aim for even more environmentally friendly production.

Greenery

We cut and deliver greenery throughout the season. We try to avoid keeping a stock, as we always strive to deliver fresh products. For this reason, it is extremely useful to receive orders early, as it helps us to manage the whole production process and deliver the freshest possible products.

About Egebro

The company is owned by Carsten Egebro, who oversees day-to-day operations together with Tine Friis Andersen. Carsten Egebro is a qualified forestry and landscape engineer and worked as a forester for several years. Tine Friis Andersen is a qualified agronomist.

The Egebro company mainly sells firewood to private and commercial consumers and grows Christmas trees and greenery for wholesalers and cemeteries.
